CLAIM AMENDMENTS:

Please amend Claim 1 as follows.

(Currently Amended): An image pickup apparatus comprising:

 a plurality of pixels;
 a color filter array of four filters disposed on said plurality of pixels,
 wherein said color filter array has a periodicity unit of two rows x

 two columns; and

an operation circuit which provides at least two different color difference signals on the basis of using all the pixels included in the periodicity unit of two rows x two columns,

wherein colors of the color filters in the periodicity unit of two rows x two columns are all different from each other and have fixed positions.

2. (Previously Presented): An image pickup apparatus according to claim 1, wherein the color filters in the periodicity unit include a filter for transmitting only green light in a visible light range, a filter for intercepting only blue color in the visible light range, a filter for intercepting only green light in the visible light range, and a filter for intercepting only red light in the visible light range.

- 3. (Previously presented): An image pickup apparatus according to claim 1, further comprising a first operation unit which performs an operation of A + B C
 D, where A, B, C, and D represent signals picked up from an area of two rows x two columns.
- 4. (Original) An image pickup apparatus according to claim 3, wherein the signals A and B are disposed on a same line or on a same column, and the signals C and D are disposed on a same line or on a same column.
- 5. (Previously presented): An image pickup apparatus according to claim 3, further comprising a second operation unit which performs an operation of A+C-B-D.
- 6. (Original) An image pickup apparatus according to claim 5, wherein the signals A and B are disposed on a same line or on a same column, and the signals C and D are disposed on a same line or on a same column.
- 7. (Previously presented): An image pickup apparatus according to claim 1, further comprising:
- a first read-out unit which reads out a difference between: (a) an addition signal of a first row, first column signal and a first row, second column signal, and

(b) an addition signal of a second row, first column signal and a second row, second column signal, in an area of two rows x two columns, and

a second read-out unit which reads out a difference between: (a) an addition signal of a first row, first column signal and a second row, first column signal, and (b) an addition signal of a first row, second column signal and a second row, second column signal, in the area of two rows x two columns.

- 8. (Previously presented): An image pickup apparatus according to claim 7, wherein areas of two rows x two columns are disposed without any space therebetween.
- 9. (Previously presented): An image pickup apparatus according to claim 1, further comprising a read-out unit that reads out an addition signal of all signals in an area of four rows x one column.
- 10. (Previously presented): An image pickup apparatus according to claim 1, further comprising a read-out unit that reads out an addition signal of all signals in an area of one row x four columns.

11 - 39. (Cancelled)
